

TIPS FOR FAMILY & FRIENDS

Before a care decision is made:

- Consider your relative or friend's end of life values and preferences
- Stay informed and ask questions
- Encourage your relative or friend to be as independent and participate in as many decisions as he or she is able

With a health care provider, explore and discuss options:

- For drugs to help with shortness of breath and fluid retention
- Before you give your relative or friend any over the counter drugs (e.g. Advil) or natural health products
- For diet (e.g. low salt intake or dealing with low appetite)
- For dealing with fatigue (e.g. promote physical activity)

Your health is important too. If you are feeling overwhelmed, seek support from your health care provider.

What should I ask about?

- What are my or my relative or friend's biggest fears about my/his/her health?
- How can I help maintain my or my relative or friend's quality of life?
- What symptoms do I, my relative or my friend have that are related to Heart Failure?
- What are the options when I am or my relative or friend is no longer responding to the Heart Failure medications?
- What should I expect when I am or my relative or friend is dying?

WHAT IS A PALLIATIVE APPROACH?

This pamphlet was made to help persons with **Heart Failure (HF)** and their families know what to expect at the end of life so they can plan ahead. Talking about preferences early on is an important first step to a **Palliative Approach to Care**.

A Palliative Approach:

- Is for residents in long term care (LTC) with conditions that have no cure
- Shifts focus from prolonging life to maintaining quality of life
- Is an active approach that can start at any stage of chronic illness
- Is part of usual care
- Does not require a referral

A **Palliative Approach** includes:

- Treatment of curable conditions
- Pain and symptom management
- Social and spiritual support

What is Heart Failure?

Heart Failure is a chronic **progressive life-limiting illness**. This means that symptoms worsen over time and may affect how long one lives. Heart Failure:

- Occurs when the heart is not pumping as strongly as it should
- Causes fluid to back up from blood vessels into the lungs and legs

Residents with Heart Failure:

- Will have bad days (more symptoms) and good days (less symptoms)

HOW DOES HEART FAILURE PROGRESS?

It is difficult to predict how long someone with Heart Failure may live, so it is good to hope for the best and plan for the worst.

Living with Heart Failure

The progression of Heart Failure cannot be reversed and there is no cure. Being well-informed will help you to make care decisions if you are able.

TALK TO YOUR OR YOUR RELATIVE OR FRIEND'S HEALTH CARE PROVIDER IF YOU NOTICE:

- More weakness or tiredness (fatigue)
- More shortness of breath with little activity or at rest
- Weight gain (fluid retention) or weight loss (nausea or loss of appetite)
- More swelling in lower legs (edema) or in abdomen (ascites)
- Coughing (with or without sputum) that may worsen when lying down
- Rapid or irregular heart rate at rest
- More problems with cognitive function
